

**FOR  
BALLAST FILLED  
TIRES**

**No more liquid leaks means less downtime,  
repair costs, delays and aggravations.**

SEALTITE BALLAST BOOST reduces flats by permanently sealing punctures in the tread area for the life of the tire, regardless of the number of additional punctures. Punctures up to 1/2 inch in diameter in the tread area are quickly sealed, smaller punctures in the side wall are often sealed along with leaks around the bead and valve.

#### **How does it work?**

SEALTITE BALLAST BOOST is a concentrate of fibers that disperse in the ballast solution once injected inside the tire. When a puncture occurs the fibers quickly cross hatch and fill the puncture from the inside.

SEALTITE BALLAST BOOST does not affect breaking down the tire in any way. The water based product contains no glues or adhesives; therefore, it will not bond to the rubber or the rim. It is non explosive, non-flammable and non-combustible.

Using the recommended dosage, tires are protected from multiple punctures for the life of the tire. Testing in many different vehicles showed a 100% success rate with over 60 punctures.

SEALTITE BALLAST BOOST can be installed with a Calcium Chloride Pump. It can be mixed with any liquid ballast solution before or after the liquid ballast is injected into the tire.
